Executive Summary

The main goal of the workshop of the project was to disseminate the scientific and technological results of the project to a wide audience and facilitate future collaborations. To this end, the consortium invited representatives of research and industry organizations and provided a summary of the project's results, highlighting the distinct research outcomes and technological components. The workshop of the project was organized on the 08 April 2022 in an open (i.e., accessible to anyone) and online format due to the restrictions imposed by the COVID-19 pandemic. Organizations from the industry and academia joined the meeting to learn about the project, its results, and discuss possible collaborations.

The workshop started with a presentation of the areas of data visualization, visual exploration and analysis, which has gained great attention recently. It then presented the important problems arising from not considering the human characteristics in the exploration process, leaving users, with different backgrounds, expertise and experience, being overloaded from the vast amount of high-quality visual information, which in turn, severely hinders their ability to efficiently assess situations, plan accordingly and swiftly take action. Next, it highlighted that most platforms still adopt a one-size-fits-all approach, providing only rudimentary support for customizing visualizations, based on predetermined alternatives and limited options that are available from the providers based on their understanding on what the end-users might want and need. The project's goal was then presented, highlighting how it aims to incorporate the users' individual differences in information processing, cognitive abilities, perceptual preferences, domain expertise and experience, to allow them to better understand the visual information and quickly act upon it.

Next, the scientific outcomes and publications and technological outcomes of the project were presented. The presentation demonstrated the key outcomes for both dimensions, aiming to allow the audience, regardless of expertise (i.e., academic or professional) and organizational culture to understand the key contributions. The presentation then proceeded with a Q&A session and concluded with the next steps.

At the end of the presentation, the workshop organizers received feedback that it efficiently and effectively presented the project outcomes. Noteworthy, was the fact that potential research and innovation collaborations were identified immediately after, including: (i) the design and development of persona-based user interfaces for existing software operated by industry partners; (ii) the joint participation in research and innovation projects related to incorporating adaptive visualizations to support efficient and effective data explorations but also improve trustworthiness; (iii) to evaluate the time spent on data exploration tasks to reveal bottlenecks.

IDEALVis Concept

**Business users are
different**

They vary in terms of expertise,
experience, preferences and cognitive
characteristics

However,

Yet...

- 1 platforms still adopt a **one-size-fits-all** approach
- 2 Tools do not provide support for personalization
- 3 There is no ability to learn and adapt

Business Intelligence Visualizations

Multiple Visualization Types for Structured / Unstructured Data

Automated Visualization Recommendations

Visualization Customization Features

Not Personalised

Follow the One-Size-Fits-All Approach

Are built with Data/Task driven Models

Do not Account for the UNIQUE user's Characteristics

To better illustrate the problem...

User Study 1 – Understanding the Business Context

RQ1 Which are the most common tasks of the data analyst in the business domain regarding data visualization and exploration?

RQ2 What kind of data, visualizations and methods are used for the defined tasks?

RQ3 Which are the main challenges and needs of data analysts in the business domain?

Amyrotos, C., Andreou, P., Germanakos, P.: **Human-Centred Persona Driven Personalization in Business Data Analytics**. In: Adjunct Proceedings of the 29th ACM Conference on User Modeling, Adaptation and Personalization. pp. 175–180. Association for Computing Machinery, New York, NY, USA (2021).

Business Context

User Dimension:

- Functioning context / business role?
- Domain expertise and experience?
- Cognitive abilities?
- Requirements / needs?

Visualizations Dimension:

- Which are used in the business domain?
- Their task compatibility?
- How can each be altered for adaptation?

Data Dimension:

- Data integration mechanisms
- Size, type, acquisition and dynamicity of data

Tasks Dimension:

- Units of work towards a business goal
- Usually based on business role
- Difference from other domains?

“

Amyrotos, C., Andreou, P., Germanakos, P.. 2021. **Adaptive Business Data Visualizations and Exploration: A Human-centred Perspective**. In Proceedings of the 5th HUMANIZE Workshop.

Perceived Expertise Tool in Business Data Analytics

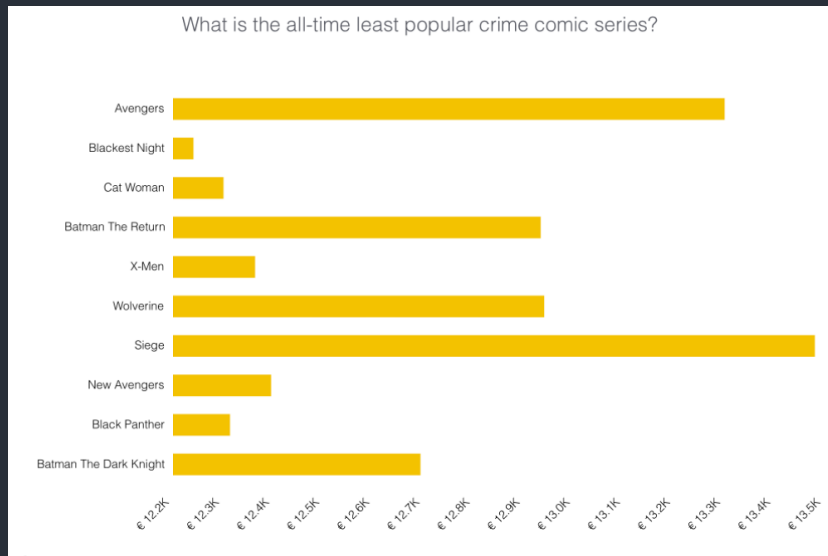

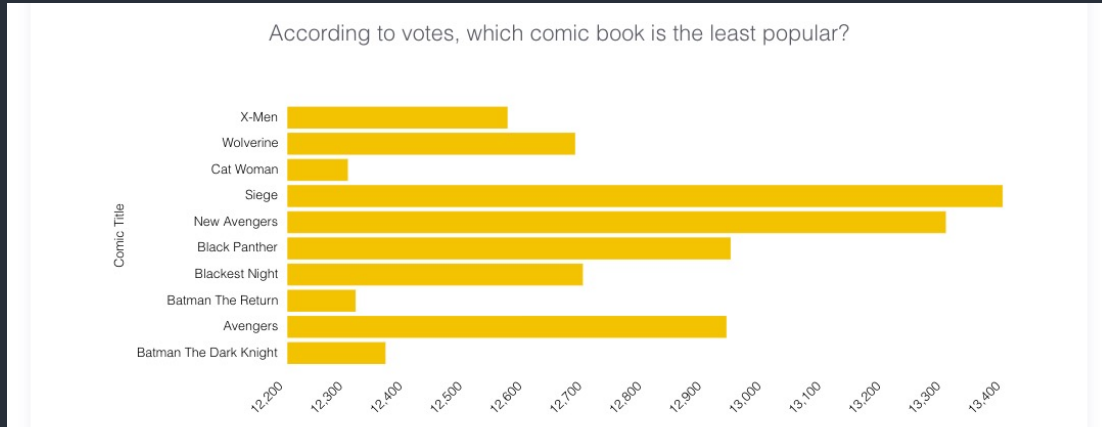

ID	PET Items (1 = strongly disagree; 5 = strongly agree)	Stage
1.	I strictly adhere to taught rules, theories or principles for analyzing my data	Novice
2.	I trust my judgement for evaluating the current data analysis situation (upon receiving a request and prior starting my task), over the taught practices and models for data analysis	Novice
3.	I often perceive current data exploration situations as “familiar” and I use previous relevant cases to tackle them	Adv. Beginner
4.	As an initial reaction during the preparation phase, I usually treat new data analysis requests as separate cases, instead of classifying them in predetermined categories based on my experience	Adv. Beginner
5.	Before I start a data exploration, I usually have an understanding of the intermediate steps (specific methodology/ strategy in mind) that will lead me to my goal	Competent
6.	I have the capability to deal with more than one requests at the same time (multiple activities/ requests) during data analysis	Competent
7.	I have a holistic understanding, based on my experience, of the data analysis that is required for a specific request	Proficient
8.	I usually adapt models or data exploration methods to my current data analysis situation, e.g., indicating deviations from normal patterns (that may apply to repeated data analysis requests)	Proficient
9.	I take the risk of creating alternative exploration paths for analyzing data based on my perception of what is possible and more effective	Expert
10.	I trust my intuition during data analysis	Expert

- ✓ A 10-item “off-the-shelf” instrument, **Perceived Expertise Tool (PET)**, based on Dreyfus & Dreyfus (1980) five-stage model, for measuring the perceived expertise of individuals
- ✓ Preliminary evaluation in the data analytics domain showed that PET has an **acceptable internal consistency**
- ✓ Significant **correlation with affiliated theoretical and domain-specific factors**, suggesting the theoretical validity of the proposed instrument
- ❖ May enable the **prediction of behaviors** that would be beneficial for the **creation of related adaptation and personalization techniques**

“

Germanakos, P., Lekkas, Z., Amyrotos, C., Andreou, P.: **Proposing a Perceived Expertise Tool in Business Data Analytics**. Personalization - User Experience Effect

TIP: **Pragmatic quality** focuses on the task-oriented nature of an experience i.e., its efficiency / ease of use, whereas **hedonic quality** focuses more on the appeal, fun, and originality aspects.

Technological Outcomes

Technological Components

User Modeling

- Seamless experiment setup
- Open/Flexible for new experiment types
- Presents individual and group statistics
- Data retrieval (.csv)

Task Mining

- Records time for each observed component (e.g., chart)
- Can identify bottlenecks in processes

Adaptive Visualizations

- Customized Adaptation Engine (Ensemble)
- Flexible to include more elements
- Dynamic dashboards
- Persona-based UX

Next Steps

- Unobtrusive Intelligent User Interface (IUI) that ensures a seamless interaction between the users and IDEALVis, context-aware support and service continuity.
- To investigate further human factors (with focus on sensitive groups) and their relationship with current for enhancing the validity and inclusiveness of current human-centred model
- To define qualitative personalized explanations and effective adaptive interventions that will be triggered by the user profiles and the individual differences for tackling complex/critical business tasks
- Application in different industry domains
- Infer cognitive factors based on interaction
